

Dimension	Baseline	Superforecasting
Role framing	"Expert forecaster"	"Expert forecaster trained in superforecasting methodology"
Starting point	—	Outside view first: consider base rates and reference classes
Factor selection	—	Granular decomposition: distinct, measurable; no vague/overlapping factors
Edge criteria	—	Signal vs noise: defensible causal mechanism, not just topical relevance
Edge validation	—	Counterfactual test: "Would the outcome change if this factor were different?"
Calibration	Be well-calibrated; avoid defaulting to 50%	Use historical base rates as anchors; avoid round numbers
DAG structure	Nodes = factors, edges = causal links, 1 outcome node	Same

Superforecasting prompt adds 5 structured principles; baseline relies on implicit LLM priors for factor selection and edge validation.
